Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

This 5' primer is used with a 3' primer (see AAV07954) in the PCR amplification of Helicobacter, e.g. Helicobacter pylori, genomic DNA in order to obtain DNA (see AAV07921) encoding the unprocessed form of a 76 kDa polypeptide (see AAW073032) designated GHPO 1414. The isolated polynucleotide, and encoded polypeptide, can be used to develop vaccines for the treatment and prevention of Helicobacter
                                                                                                         Claim 5;
                                                                                                                                   New isolated Helicobacter polynucleotides - for the diagnosis, prevention and treatment infections and gastroduodenal diseases
                                                                                                                                                                                                 WPI; 1998-568251/48.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sequence 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              diseases such as conventional trachoma, nonendemic trachoma, paratrachoma, and inclusion conjunctivitis; genital diseases such as nongonococcal uretritis, epidymitis, cervicitis, salpingitis, perihepatitis, bartholinitis; pneumopathy in breast feeding infants; and venereal lymphogranulomatosis. The polypeptides of the invention may be of use in treating these diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    PCR primers AAZ01426-Z06209 were used to amplify open reading frames (ORFS) of the genome of Chlamydia trachomatis (see AAZ01425). These ORFS encode polypeptides (see AAY36724-Y37949) which can be used as vaccines against Chlamydia trachomatis. Antisense and ribozyme sequences can also be used to control growth of the microorganism. Chlamydia trachomatis is responsible for a large number of diseases, e.g. eye

The isolated polypucleotide, and encoded polypeptide, can be used to develop vaccines for the treatment and prevention of Helicobacter

                                                                                                                                                                                                                                                                                                                                                                                                                                AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          This 17-mer oligonucleotide DNA probe, along with Probe-2 (AAQ92085) are used to screen an R. reniformis cDNA library to isolate cDNA encoding Renilla luciferase. The luciferase was then expressed using E. coli.
                                                                                                                                                                                                  (GEST ) GENSET

                                          The invention relates to an isolated polypeptide of human lipoprotein 105 containing a cytochrome c structural domain. The polypeptide comprises a 951 amino acid sequence given in the specification, or its fragment, analogue or derivative. The polypeptide and encoded polypucleotide are useful in the diagnosis and treatment of malignant tumours, haemopathy, HIV infection, immunological diseases and various inflammatory diseases. The present sequence is a primer which was
                                                                                                                                                                                                                         Human lipoprotein 105 containing cytochrome c structural domain and encoded polynucleotide, applicable in diagnosis and treatment of malignant tumor, hemopathy, HIV infection, immunological diseases and

C. pneumoniae causes respiratory disease such as pneumonia and borochitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encode by the open reading frames of the C. pneumoniae genome (see AAX93684-AAX93879) can be used in immunogenic compositions as vaccines. Vectors

                                                                       The present invention describes a method (M1) of determining an C individual's predisposition to epilepsy and/or development of epilepsy. C as well as predicting the individual's response to medication. The C method comprises determining the genotype of at least one gene selected CC from SCNIA, SCNIA or SCNIA, or a DNA variant, equivalent, or mutation CC which shows a linkage disequilibrium. SCNIA, SCNIA and SCNIA are all C sodium channel genes located on chromosome 2. The idiopathic generalised CC epilepsy (IGE) gene is more specifically localised on chromosome C q23-q31. Compounds identified as modulators of the biological activity CC of SCNIA, SCNIA or SCNIA proteins or genes, are useful for treating CC epilepsy or other neurological disorders. They have anticonvulsant and CC neuroprotective activities. AAH55763 to AAH56164 and AAB99674 to CC AAB99679 represent SCNIA, SCNIA, and SCNIA cDNAs, gene fragments, PCR CC primers, oligonucleotides and proteins given in the exemplification of

                                                                                                                                                                                                                                                                                              AAC67342 standard;
                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 26
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention describes a novel method for determining the risk of or diagnosing Alzheimer's disease using single nucleotide polymorphisms (SNPs) present in an individual's mitochondrial DNA (mtDNA). In addition, the SNPs identified can be used to identify agents suitable for use in treating Alzheimer's disease. Sequences AAC67301-C67610 are PCR primers used to demonstrate the method of the

This 5' primer was used with a 3' primer (see AAV07958) in the PCR amplification of Helicobacter pylori strain ORV2001 genomic DNA in order to obtain DNA (see AAV72001) encoding a 76 kDa polypeptide (see AAW73022) designated GHPO 386. The primer pair includes a 5' clamp and BamHI and XhoI restriction enzyme recognition sequences for cloning purposes. The PCR product was ligated into vector pET28a, and recombinant polypeptide was expressed as a histidine-tagged fusion protein in E. coli host cells. The polypeptide can be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      of or diagnosing Alzheimer's disease using sligle nucleotide polymorphisms (SNPs) present in an individual's mitochondrial DNA (mtDNA). In additon, the SNPs identified can be used to identify agents suitable for use in treating Alzheimer's disease. Sequences AAC67301-C67610 are PCR primers used to demonstrate the method of the invention.

                                                                                                           This invention describes a novel recombinant RNA molecule (I), at least CC partly translatable in a target cell which comprises: (a) the conditions genome (A) of Group B Coxsackie virus (CVB), particularly construction and (b) at least one foreign gene (II) that can be developed convention also describes (1) a recombinant infectious virions (V), CC derived from (A) and containing (I); (2) a plasmid vector containing the construct for complementing the coding sequence exchanged by (I); (4) constructs of (3); (7) a kit containing the vector of (2) or the helper constructs of (3); (8) a DNA molecule (IV) containing at least one coding sequence for (I); (9) a kit containing (IV); (10) a kit for performing constructs of (3); (11) a DNA construct that encodes (I) and can persist (and is transcribed) in target cells, but is preferably not replicable; (12) a recombinant virus (RV), particularly adeno or retro, that encodes (I) and is expressed after infection into a target cell to produce a cytoplasmic replicon that is continuously replenished; (13) producing crecombinant DNA viruses or virions having a DNA genome that lacks a crecombinant vector system with a RNA genome. The products of the crecombinant vector system with a RNA genome. The products of the crecombinant vector system with a RNA genome. The products of the crecombinant vector system with a RNA genome. The products of the crecombinant vector system with a RNA genome. The products of the crecombinant vectors service activity and can be used for gene therapy. (C) is used to produce gene therapy vectors, particularly plasmids or congenital or acquired. (I) particularly vectors derived from DNA viruses, articularly vectors derived from DNA viruses.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         δÃ
        particular gene sequences, particularly vectors derived from DNA virus vectors based on (I) transfer genes to cardiac myocytes without immunological or other side effects. The RNA genome can replicate, providing efficient gene transfer and long-term expression of the therapeutic gene. CBV is naturally trophic for heart muscle and since
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            useful
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Recombinant RNA comprising heterologous gene in Coxsackie viral genome, useful in gene therapy, specifically for targeting of cardiac myocytes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Coxsackievirus

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      δÃ
                                                                  The present sequence is that of primer 3A, which is 1 of a set of C a nested primers (see also AAF90561 and AAF90562) homologous to C the 3' DS3 region of Dissociation transposon. Arbitrary degenerate Primers (see AAF90551-56) were used to prime Arabidopsis thaliana C genomic DNA flanking the site of a Ds transposon insertion. The C degenerate primers were used in combination with 2 sets of 3, nested, transposon-specific primers homologous to the DS3 region or DS5 region (see AAF90557-59) of the Ds element, which lie at the C outermost ends of the transposon. Low- and high-stringency PCR amplifications were performed using the TAIL-PCR produced. DNA 1C fragments were produced which corresponded to the genomic DNA that C was directly adjacent to the transposon insertion. Sequence analysis of PCR products from tagged seedling lethal lines E71158, C most of the sessential for Arabidopsis seedling growth and development. The essentiality of the genes provides a means of discovering new herbicides. Screening assays for identifying
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         망
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Matches
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Query Match

                            discovering new herbicides. Screening assays for identifying inhibitors that are potential herbicides are provided. The invention is also applied to the development of herbicide tolerant plants, and plant tissues, seeds and cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ET1158 gene; GT6839 gene; ET5262 gene; herbicide tolerance; transgenic plant; Dissociation; transposon; maize; PCR pr

                                                                                                                                             primers MW093 (AAT34127) and MW110 (AAT34128) were used to generate a 100 bp PCR fragment, PCR-HTIV18, contg. the 13L promoter fused to the 5'-end of the HTLV-I envelope gene, using pMM102 as template. Primers MW113 (AAT34129) and MW116 (AAT34130) were used to generate 1,500 bp PCR fragment, PCR-HTIV21, contg. the 3' end of the 13L promoter fused to the entire HTLV-I envelope gene, using p17-SST as template. MW093 and MW116 were then used as to amplify PCR-HTIV18 and PCR-HTIV21. The 13L-promoted envelope gene was cloned between canarypox virus C5 flanking arms and also between vaccinia HA flanking arms, and a NYVAC recombinant expressing HTLV-I env was generated. This effectively primed protective immune responses

                                                                                                                                                                                                                                                    NYVAC recombinants expressing HIV-2 gene products. NYVAC is a Copenhagen vaccine strain of vaccinia virus which has been modified by deletion of six non-essential regions of the genome encoding known or potential virulence factors. The deletion loci were engineered as recipient loci for the insertion of foreing genes. The HIV-2 env sequence was isolated in two portions by polymerase chain reaction (PCR). These fragments were then ligated also by PCR. The HIV-2 gpl20 gene was also isolated by PCR. These HIV-2 genes were transfected into NYVAC which could then be cultured in Vero cells. The envelope proteins were found to be present on the cell surface of cells transformed with the recombinant NYVAC. See AAQ35501-864.

converting the sites of polypeptides by CompT protease by preventing cleavage at unwanted sites by converting the amino acid residue at position +1 to the site is Lys or Arg), and/or converting the residue at converting the site is Lys or Arg), and/or converting the residue at converting the residue at position -4 and/or -6 to a specifically defined amino acid. Also described is a method for the fission of a fusion protein to give a convertine has a linker peptide inserted between the desired polypeptide polypeptide inserted between the desired polypeptide and the other part of the fusion protein. The fusion protein may be converted by expression of DNA encoding in a suitable host cell such as Escherichia coli. OmpT protease is a membrane protease of Escherichia coli which cleaves peptide chains at a two-residue sites in which both cresidues are basic amino acids such as arginine or lysine. The methods con be used for the efficient preparation of undegraded desired polypeptides such as natriuretic peptide by OmpT protease cleavage after recombinant expression as a fusion protein. AAA99177 and the present invention.

         Primers AAZ61218-45 were used to construct a synthetic Streptomyces hygroscopicus bar gene. The bar gene encodes phosphinothricin acetyltransferase, which provides protection from phosphinothricin toxicity. The synthetic gene has improved containment and enhanced expression in plant plastids, and is used to produce recombinant DNA constructs of the invention. The specification describes recombinant DNA constructs for expressing heterologous proteins (e.g. bar gene product) in the plastids of higher plants. The DNA constructs comprise a 5'
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Two primers (AAQ48716-17) are described for the isolation of Bacillus thuringiensis israelensis DNA. The sequence of one 27-mer primer (AAQ48716), however is missing from the specification. Caulobacter transformed with a plasmid contg. a gene encoding insecticidal protein derived from Bacillus thuringiensis or Bacillus sphaericus will proliferate in aq. environment. They may be consumed by larvae of mosquitoes and are lethal to

                                         Primers AAZ61218-45 were used to construct a synthetic Streptomyces hygroscopicus bar gene. The bar gene encodes phosphinothricin acetyltransferase, which provides protection from phosphinothricin toxicity. The synthetic gene has improved containment and enhanced expression in plant plastids, and is used to produce recombinant DNA constructs of the invention. The specification describes recombinant DNA
constructs for expressing heterologous proteins (e.g. bar gene product) in the plastids of higher plants. The DNA constructs comprise a 5' regulatory region which includes a promoter element, a leader sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   heterologous protein. The chimeric regulatory region enhances translational efficiency of an mRNA molecule encoded by the DNA construct. The DNA constructs are used for producing transformed monocot and dicot plants having high levels of heterologous protein expression. They can be used to drive expression of proteins with agronomic, industrial or pharmaceutical importance, including production of vaccines, healthcare products like human haemoglobin, industrial or household enzymes. Plants which can be transformed with the constructs of the invention include maize, millet, sorghum, sugar cane, rice,
                                                                                                                                            Example
                                                                                                                                                                                    heterologous
                                                                                                                                                                                                New recombinant DNA constructs,
                                                                                                                                                                                                                                                        Maliga

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              and a downstream box element operably linked to a coding region of the heterologous protein. The chimeric regulatory region enhances translational efficiency of an mRNA molecule encoded by the DNA construct. The DNA constructs are used for producing transformed monocot and dicot plants having high levels of heterologous protein expression. They can be used to drive expression of proteins with expression. They can be used to drive expression of proteins with expression, industrial or pharmaceutical importance, including production of vaccines, healthcare products like human haemoglobin, industrial or household enzymes. Plants which can be transformed with the constructs of the invention include maize, millet, sorghum, sugar cane, rice,
                                                                         polymorphic marker. This sequence can be used in the construction of allele-specific primers and probes for amplification or hybridisation, e.g. to determine common or disparate ancestry between 2 or more plant
                                                                                                                                                  This DNA sequence is a region of a Zea mays genome which contains

This sequence can be used in the construction of allele-specific primers and probes for amplification or hybridisation, e.g. to determine common or disparate ancestry between 2 or more plants,
                                                                                                                                                                                                                                                                                                                Sequence 41

                                                                                                                                                                                                                                                                                          A single-stranded DNA (or its complementary strand or the corresp. double-stranded DNA) which comprises one of the 7837 "GS" sequences given in AAR19001-T26837 and which is able to hybridise to part of human genomic DNA, cDNA or mRNA is claimed. The GS (Gene Signature) sequences were obtained from 3'-directed cDNA libraries prepared from various human tissues; synthesis of cDNA was initiated from the 3'-end of mRNA by using poly(T) as the sole primer. Since the 3'-untranslated sequence is unique to a particular mRNA species, almost
                                                                                                                                                                                                               all the 3'-oriented cDNAs hybridise with specific mRNAs. Each library is constructed so as to reflect accurately the relative abundance of different mRNAs in the particular tissue from which it was derived. The appearance frequency of a given GS in a cDNA library can be determined (esp. using primers and proches decimal force).
                                                                                                                                                                           determined (esp. using primers and probes derived sequences) as a means of diagnosing abnormal cell recognising different cell types.
                                                                                                                                               Sequence 50 BP;
                                                                                                                                                                                                                                                                                                                                                                                                                                             Claim 1;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CC construct a synthetic DNA plasmid sequence synlux4, to demonstrate the CC construct a synthetic DNA plasmid sequence synlux4, to demonstrate the CC method of the invention. Within the synlux4 sequence are included the CC method of the invention. Within the synlux4 sequence are included the CC sequences of lux A, lux B, the A and B components of the Vibrio fisheril CL luciferase sequence, positions of pUC19 including the origin of CC replication and replication stability sequences, and the promoter and CC coding sequence for tn9 kanamycin/neomycin phosphotransferase. The CC specification describes a method for the synthesis of replication CC competent double-stranded polynucleotides. The method comprises CC generating a first set of oligonucleotides. The method comprises CC strand and a second set corresponding to the minus strand and CC annealing. The method can be used for preparing polynucleotides CC encoding sequences involved in a blochemical pathway. In particular, CC they can be used to produce polynucleotides encoding enzymes.

CC e.g. hexpkinase, phosphohexose isomerase, phosphofructokinase-1, contains the place of the produce polynucleotides contains the place of aldolase, triose-phosphate isomerase, phosphofructokinase-1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                coding sequence for the kanamycin/neomycin phosphotransferase. The specification describes a method for the synthesis of replication competent double-stranded polynucleotides. The method comprises generating a first set of oligonucleotides corresponding to the plus strand and a second set corresponding to the minus strand and annealing. The method can be used for preparing polynucleotides encoding sequences involved in a biochemical pathway. In particular, they can be used to produce polynucleotides encoding enzymes, e.g. hexokinase, phosphohexose isomerase, phosphofructokinase-1, aldolase, triose-phosphate isomerase, glyceraldehyde-3-phosphate
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     dehydrogenase, phosphoglycerate kinase, phosphoglycerate mutase, enclase or pyruvate kinase. They can also be used for the prepar of viral particles, artificial genomes and artificial genetic sy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AAX52021-212 represent oligonculeotide primers that were used to construct a synthetic DNA plasmid sequence synlux4, to demonstrate the method of the invention. Within the synlux4 sequence are included the sequences of lux A, lux B, the A and B components of the Vibrio fisherii luciferase sequence, positions of pUC19 including the origin of replication and replication stability sequences, and the promoter and replication stability sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VEGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flk-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. AAX67275 to AAX75752 represent specific examples of nucleic acid molecules from the present invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes nucleic acid molecules which modulate the synthesis, expression and/or stability of a mRNA encoding 1 or more receptors of vascular endothelial growth factor (VBGF). A patient (preferably human) having a condition associated with the level of the fms-like tyrosine kinase 1 (flt-1), kinase insert domain containing receptor (KDR) and/or foetal liver kinase 1 (flt-1) (e.g. tumour angiogenesis, ocular diseases, psoriasis and rheumatoid arthritis) can be treated by administering the nucleic acid molecule or the expression vector to the patient. ANX67275 to ANX75725 represent specific examples of nucleic acid molecules from the present invention.
           Novel ribozymes for modulating the synthesis, expression and/or stability of an mRNA encoding an angiogenic factors \,\cdot\,
                                                                                                                                                                                                                                                                                                                                      myopic degeneration; psoriasis; verruca vulgaris; angiofibroma; tuberous sclerosis; pot-wine stain; Sturge Weber syndrome;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Claim 4;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Nucleic acid molecule modulating VEGF receptor(s) gene expression mRNA stability - useful for treating e.g. tumour angiogenesis, psoriasis, rheumatoid arthritis, etc., in a human patient
                                                              WPI; 1999-591315/50.

CC hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 cgene, an integrin alpha 6 subunit gene, or a Tie-2 gene. AAA16775 to CC AAA17167 and AAA17561 to AAA17627 represent ribozyme sequences for ARNT, CC and AAA17168 to AAA17560 and AAA17633 to AAA17684 represent their CC corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to CC AAA19154 represent ribozyme sequences for Tie-2, and AAA19087 to CC AAA19124 represent ribozyme sequences for Tie-2, and AAA19087 to CC and AAA19155 to AAA19222 represent their corresponding target sequences; CC AAA1923 to AAA2361 and AAA21501 to AAA21505 represent ribozyme sequences for integrin alpha 6 subunit, and AAA20362 to AAA21500 and CAAA21509 to AAA21688 represent their corresponding target sequences; CC AAA21689 to AAA21688 represent their corresponding target sequences; CC AAA21689 to AAA21675 and AAA23363 to AAA23142 represent ribozyme sequence of the invention are used for modulating the synthesis, expression and/or CC constitute of an mRNA encoding angiogenic factor, especially ARNT, CC integrin subunit beta 3, integrin subunit alpha-6, or Tie-2. They are cespecially used to treat cancer, diabetic retinopathy, age related CC macular degeneration (ARMD), inflammation, and arthritis, as well as consistent of tuberous sclerosis, pott-wine stains, Sturge Weber Stundforme. Cistant subarrame of tuberous sclerosis, pott-wine stains, sturge Weber Stundforme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel ribozymes for modulating the synthesis, exprestability of an mRNA encoding an angiogenic factors
Sequence
                                                 syndrome, Kippel-Trenaunay-Weber syndrome, Osler-Weber-Rendu syndrome, and other syndromes and diseases related to the levels of ARNT, Tie-2, integrin subunit alpha-6, or integrin subunit beta-3.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Claim 55; Page 209; 305pp; English.

The ribozymes of the invention are used for modulating the synthesis, expression and/or stability of an mRNA encoding angiogenic factor, especially ARNT, integrin subunit alpha-6, or Tie-2. They are especially used to treat cancer, diabetic retinopathy, age related macular degeneration (ARMD), inflammation, and arthritis, as well as neovascular glaucoma, myopic degeneration, psoriasis, verruca vulgaris, angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber angiofibroma of tuberous sclerosis, pot-wine stains, Sturge Weber
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 hydrocarbon nuclear transporter (ARNT) gene, an integrin subunit beta 3 gene, an integrin alpha 6 subunit gene, or a Tie 2 gene. AAA16775 to AAA17167 and AAA17561 to AAA17622 represent ribozyme sequences for ARNT, and AAA17168 to AAA17502 and AAA17623 to AAA17684 represent their corresponding target sequences; AAA17685 to AAA18385 and AAA19087 to AAA19124 represent ribozyme sequences for Tie-2, and AAA19185 to AAA19022 represent their corresponding target sequences; AAA19223 to AAA19223 represent their corresponding target sequences; AAA19223 to AAA20361 and AAA21501 to AAA21505 represent ribozyme sequences for integrin alpha 6 subunit, and AAA20362 to AAA21500 and AAA21506 to AAA21688 represent their corresponding target sequences; AAA21506 to AAA21688 represent their corresponding target sequences; AAA21506 to AAA21507 and AAA23263 to AAA23342 represent ribozyme sequence integrin subunit beta 3, and AAA23476 to AAA23362, AAA23343 to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of crythropoietin, granulocyte colony stimulating factor
                         Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoletin -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
                                                                                                                                                                                                                                                                                                                                    The present invention relates to enzymatic and antisense nucleic acid molecules that act as inhibitors of the expression of repressor genes encoding the TR2 Orphan receptor, EAR3/COUP-TF-1, the GATA transcription factor gene, IRF-2 and/or the CAATT Displacement Protein (CDP). Inhibition of the repressors removes prevents inhibition (and consequently increases expression of) genes involved in the production of erythropoietin, granulocyte colony stimulating factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Enzymatic and antisense nucleic acid inhibition of repressor genes, useful for producing e.g. granulocyte colony stimulating factor protein, interferon alpha and erythropoietin -
                                                                                                                                                                                                                                                                                                                the production of erythropoletin, granulocyte protein and interferon alpha.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Claim 37; Page 87; 164pp;
                                                                                                                                                                                                                                                               Sequence 17

                                                                                                                                                                                                                                                                                                                                                                                                                                                                            CC PCR. The data obtained were averages from three experiments. This cantisense oligonucleotide provided (0% inhibition of surivin mRNA. It was found that ISIS 2367 (AAA08925) provided 70% inhibition and ISIS CZ 23672 (AAA08929) provided 64% inhibition.

CC Survivin, an IAP (inhibitor of apoptosis) Caspase inhibitor, and is expressed in the G2/M phase of the cell-cycle in a cell cycle regulated manner and contract with microtubules of the mitotic spindle. Disruption of this interaction results in loss of survivin's anti-apoptotic function and contracted with apoptotic cell death. It is therefore believed that survivin may counteract a default induction of apoptosis in the G2/M phase. It is counteract a default induction of apoptosis in the G2/M phase. It is counteract a default induction of apoptosis in the G2/M phase. It is counteract a default induction of apoptosis in the G2/M phase. It is counteract a default induction of survivin in cancer may consider this apoptotic check point, allowing undesired survival and consorted in cancer cells. Antisense oligonucleotides (ASO's) may be used to down regulate endogenous survivin and to increase caspase-3-dependent cancer cells in the G2/M phase.
                                                                                                                                                                                                                                                                                                                                                   Query Match

treatment effects from

The SEQ ID NOS 2852, 2913,

, are not actually given a sequence present invention.

AAZ65654 to AAZ69578 represent human biallelic markers from the present invention, which contain a polymorphic base at position 24 of their nucleotide sequences. AAZ69579 to AAZ77440 represent amplification primers for the biallelic markers. The biallelic markers of the invention have a variety of uses: they can be used for high density mapping of the human genome, and in complex association studies and haplotyping studies which are useful in determining the genetic basis for disease states. Compositions and methods of the invention can also be useful for the identification of the targets for the development of

pharmaceutical agents and diagnostic methods, as well as the characterisation of the differential efficacious responses to and side

pharmaceutical agents acting on a disease as well

                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence represents a PCR primer used in the present invention describing novel polypeptides, which can optionally be expressed in NCIMB 40771. The polypeptides, and polynucleotides encoding it, are derived from Staphylococcus aureus. Cells expressing ligands binding the polypeptides can be used to isolated candidate compounds that bind and inhibit the activity of the polypeptides. Such compounds can be used as anti-bacterial compounds. The polypeptides may also be used as immunogens to vaccinate an animal for protection against

                                                                                                                                                                                                                                                                                                                             Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         kernel oil concentration. The method comprises: (a) selecting a corn plant from a breeding population using at least one of the genetic markers s1375, s1384, s1394, s1416, s1422, s1432, s1457, s1480, s1476, s1478, s1484, s1500, s1513, s1529, s1544, s1545, s1630, s1633, s1647, s1780, s1750, s1751, s1772, s1774, s1780, s1797, s1813, s1816, s1817, s1836, s1853, s1860, s1870, s1921, s1922, s1925, s1931, s1933, s1939, s1946, s1949, s2054, s2055, s2057, s2058, s2097, s2122, s2125, s1939, s1946, s1949, s2054, s2055, s2057, s2058, s2097, s2122, s2125, s1939, s1946, s1949, s2054, s2055, s2057, s2058, s2097, s2122, s2125, s21930, s2156, and s2175; and (b) crossing the selected plant with a second plant and obtaining progeny with increased kernel oil concentration. Also described are: (1) a method for identifying corn plants or lines for use a parents to create a breeding population, for the content of the second plants or lines for use a parents to create a breeding population of the second plants or lines for use a parents to create a breeding population.
                                                                                                                                                                                                                                                                                                                                                                                                                        comprising: (a) genotyping corn plants or lines with one or more of the above genetic markers; and (b) identifying plants or lines which are predicted to produce transgressive segregants for kernel oil concentration; and (2) trait loci controlling kernel oil concentration mapped by the above genetic markers, with the exception of s1480.

AAV72694 to AAV72797 represent PCR primers which are used to amplify the genetic markers for use in the method of the invention.

                                                                                                                                                                                                                                 AAX391991-X97517 represent PCR primers used to amplify open reading frames and other nucleic acid sequences from the genome of Chlamydia pneumoniae (see AAX91990). C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-AAY35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions, especially where the vector directs the expression of a neutralising epitope of C. pneumoniae.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Respiratory disease; pneumonia; bronchitis; heart disease; sarcoidosis; sinusitis; purulent otitis media; erythema nodosum; pharyngitis; vaccine; neutralising epitope; PCR primer; ss.
